

DESTROY THE EGG MASSES

Slide the edge of a knife blade under the egg mass, lift the mass off and dispose of it. Egg masses can be placed in the garbage, burned, or buried in the garden or compost pile. Do not scrape them off and leave them on the ground as this does not destroy the eggs and they will hatch in the spring.

Since there are about a thousand eggs in each mass, destroying egg masses is one of the most effective and least expensive measures the property owner can take to protect trees. When gypsy moth populations are very high, it will be virtually impossible to find and destroy all of the egg masses on your property and other control methods, such as spraying the trees with an insecticide, may be necessary.

NOTIFY US

If you notice gypsy moth egg masses, caterpillars, or leaf damage in your trees in the spring and early summer, please notify the Gypsy Moth Suppression Program at one of the offices listed in this pamphlet.

Gypsy Moth Egg Mass – life size – in ivy on a tree trunk.

Tiny, newly emerged caterpillars resting on gypsy moth egg mass

LEARN WHAT GYPSY MOTH EGG MASSES LOOK LIKE

In late June or early July, the gypsy moth female lays about a thousand eggs in a single mass. Gypsy moth egg masses are about the size of a quarter, are oval, raised in the center and are tan to light brown in color. Because the female moth deposits hairs and scales from her body in the mass, it appears slightly fuzzy. The mass adheres to the surface on which it was laid - it is not in a web, tent or bag. The egg mass will remain where the female laid it until the following spring when the tiny caterpillars hatch, usually around April 15th.

Persons with allergies should use care when handling egg masses. The hairs and scales can be highly allergenic.

LEARN WHERE TO FIND GYPSY MOTH EGG MASSES

Gypsy moth females lay their egg masses in shaded, “protected” places such as the underside of tree limbs, crevices in tree bark, ivy covered tree trunks and buildings, the underside of lawn furniture, inside the wheel wells of campers and trailers, under the eaves of houses and storage buildings, and on the foundations of houses. They also like woodpiles and the inside of birdhouses!

Look for egg masses in wood piles
